	Audio processing	Constatine Akas	12/11/2026	Completed	Yes	Audio dataset consisted of eight WAV recordings collected from four participants. Each participant provided two recordings, allowing the system to examine voice characteristics across two different phrases.
	Product model	Racheal Resty Akello	13/11/2026	Completed	Yes	Built the product recommendation model in src/product_model.py using the merged dataset. Removed duplicate rows, engineered features (one 0/1 column per social platform, one-hot encoded review sentiment, scaled engagement and interest scores) and compared Logistic Regression, Random Forest and XGBoost against a baseline. To avoid data leakage, I used grouped 5-fold cross-validation and a held-out test set split by customer. Logistic Regression was selected (test accuracy 0.316 vs 0.211 baseline, F1 0.254, log loss 1.720). Saved the model and evaluation figures to outputs/product_model/.

	Tabular Data Cleaning, Merging, EDA & Feature Engineering (merged_customer_data.csv & product_model_data.csv)	kuzo divine gahima	10/11/2026	Completed	Yes	Cleaned missing ratings and duplicate social profiles, standardized customer IDs, merged datasets (117 matched records), generated EDA visualizations, and exported product_model_data.csv for the product recommendation model.
